The Logarithmic Filter

José M. González

November 4, 2013

${\bf Abstract}$

This document explains the equations for building a logarithmic filter.

Gain = 1 Point of Balance

$$G = m \log_s f - \log_s B$$

G: Gain

s: Scale

f: Frequency

B: Point of Balance

m: slope

$$G = m \frac{\ln f}{\ln s} - \frac{\ln B}{\ln s}$$

If G is defined as $1 \pm \delta$ we get, some useful equations.

$$2\delta = \frac{m}{\ln s} \ln \frac{F_{MAX}}{F_{MIN}} \tag{1}$$

$$m = \frac{-\delta}{1 - \delta} = \frac{\delta}{\delta - 1} \tag{2}$$

$$\ln s = \frac{m}{2\delta} \ln \frac{F_{MAX}}{F_{MIN}} \tag{3}$$

$$2\delta = \frac{m}{\ln s} \ln \frac{F_{MAX}}{F_{MIN}}$$

$$m = \frac{-\delta}{1 - \delta} = \frac{\delta}{\delta - 1}$$

$$\ln s = \frac{m}{2\delta} \ln \frac{F_{MAX}}{F_{MIN}}$$

$$\ln s = \frac{1}{2(\delta - 1)} \ln \frac{F_{MAX}}{F_{MIN}}$$

$$\ln B = \frac{\ln s}{m - 1}$$

$$\ln B = \frac{1}{2} \ln \frac{F_{MAX}}{F_{MIN}}$$
(6)

$$\ln B = \frac{\ln s}{m-1} \tag{5}$$

$$\ln B = \frac{1}{2} \ln \frac{F_{MAX}}{F_{MIN}} \tag{6}$$

A non logarithmic representation:
